

## ABSTRAK

### HUBUNGAN TINGKAT PENGETAHUAN TENTANG PENATALAKSANAAN IDENTIFIKASI DENGAN KESELAMATAN KERJA PERAWAT DI RUANG INAP RSUD dr. MOHAMMAD ZYN SAMPANG

Oleh : Dewi Febriyana

**Pendahuluan:** Keselamatan Kerja Perawat masih menjadi masalah utama dalam lingkungan kerja kesehatan. Angka kecelakaan kerja tertinggi pada tenaga kesehatan adalah perawat yaitu sebesar empat kali lipat dibandingkan dengan kecelakaan kerja kesehatan lainnya. Keselamatan kerja perawat di Rumah Sakit menjadi isu penting karena banyaknya kasus medical error yang terjadi di berbagai negara. Salah satu penyebab belum tercapainya keselamatan kerja perawat di Rumah Sakit karena kurangnya pengetahuan, keterampilan, sosialisasi keselamatan kerja perawat, sikap untuk menangani kompleksitas perawatan kesehatan, kepatuhan penatalaksanaan identifikasi keselamatan kerja perawat, dan komitmen dalam upaya membangun budaya keselamatan kerja perawat. Penelitian ini bertujuan untuk Menganalisis Hubungan Tingkat Pengetahuan Perawat tentang Penatalaksanaan Identifikasi dengan Keselamatan Kerja di Ruang Inap RSUD dr. Mohammad Zyn Sampang. **Metode penelitian:** Ini menggunakan metode penelitian observasional analitik dengan pendekatan cross sectional. Populasi dalam penelitian ini 50 orang, dan teknik sampling dalam penelitian ini menggunakan probability sampling dengan 44 responden. Analisa data menggunakan uji range sparmen dengan  $\alpha$  0,05. **Hasil penelitian:** Tingkat pengetahuan perawat tentang penatalaksanaan identifikasi didapatkan hampir seluruhnya (54,5%) responden memiliki pengetahuan cukup baik sebanyak 24 perawat, sedangkan penelitian hasil keselamatan kerja perawat didapatkan hampir seluruhnya (34,31%) responden dengan keselamatan kerja baik sebanyak 15 perawat. Analisa data didapatkan hasil uji range sparmen dengan value = 0,000 < 0,05 maka H1 diterima yang berarti ada hubungan tingkat pengetahuan tentang penatalaksanaan identifikasi dengan keselamatan kerja perawat di RSUD dr. Mohammad Zyn Sampang. **Pembahasan:** Tenaga kesehatan terutama perawat di RSUD dr. Mohammad Zyn, tingkat pengetahuan yang cukup baik sehingga menciptakan keselamatan kerja yang baik. **Kesimpulan:** Ada hubungan tingkat pengetahuan tentang penatalaksanaan identifikasi dengan keselamatan kerja perawat di ruang inap RSUD dr. Mohammad Zyn Sampang.

**Kata Kunci :** Tingkat Pengetahuan, Keselamatan Kerja

**ABSTRACT**  
**THE RELATIONSHIP OF THE LEVEL OF KNOWLEDGE REGARDING IDENTIFICATION MANAGEMENT WITH NURSES' OCCUPATIONAL SAFETY IN RSUD dr. MOHAMMAD ZYN SAMPANG**

**By : Dewi Febriyana**

**Introduction:** Nurse work safety is still a major problem in the health work environment. The highest number of work accidents among health workers is nurses, which is four times higher than other health work accidents. The work safety of nurses in hospitals is an important issue because of the large number of medical error cases that occur in various countries. One of the reasons why work safety for nurses in hospitals has not been achieved is due to a lack of knowledge, skills, socialization of work safety for nurses, attitudes towards handling the complexity of health care, compliance with the management of identification of work safety for nurses, and commitment to efforts to build a work safety culture for nurses. Study aims to Analyze the relationship between nurses' level of knowledge about identification management and work safety, in the inpatient room at RSUD dr. Mohammad Zyn Sampang. **Research method:** This uses an analytical observational research methods with a cross sectional approach. The population in this study was 50 people, and the sampling technique in this study used probability sampling with 44 respondents. Data analysis used the sperm range test with a 0.05. **Research results:** The level of nurses' knowledge regarding identification management found that almost all (54.5%) of the respondents had fairly good knowledge, as many as 24 nurses, while research on the results of nurses' work safety found that almost all (34.31%) of the respondents had good work safety as many as 15 nurses. Data analysis showed that the results of the parmen range test were with value =  $0.000 < 0.05$ , so  $H_1$  was accepted, which means there is a relationship between the level of knowledge about identification management and the work safety of nurses at RSUD dr. Mohammad Zyn Sampang. **Discussion:** Health workers, especially nurses at RSUD dr. Mohammad Zyn, the level of knowledge is good enough to create good work safety. **Conclusion:** There is a relationship between the level of knowledge about identification management and the work safety of nurses in the inpatient room at RSUD dr. Mohammad Zyn Sampang.
